<td>NeuraWrap nerve protector is designed to provide an interface between the nerve and the surrounding tissues. NeuraWrap remains in place during the active phase of tissue healing and is completely resorbed after tissue response has resolved. The porous outer layer of NeuraWrap comprises a tubular matrix that mechanically resists compression from surrounding tissue and excludes scar tissue ingrowth. The semi-permeable inner membrane allows passage of small molecules (ie water, ions, metabolites, nutrients) but prevents the escape of endogenous growth factors (Nerve Growth Factor). NeuraWrap provides a new alternative for the treatment of peripheral nerve injuries.</td>

The balloon catheter is recommended for use with a Stryker Neurovascular 0.014 in (0.36 mm) guidewire to seal the distal segment of the catheter lumen allowing inflation of the balloon. The guidewire can be moved distally or proximally once beyond the distal tip (seal portion) of the catheter and still maintain a positive seal for inflating the balloon. The distal outer segment of the catheter shaft is coated with a hydrophilic material that reduces friction during manipulation in the vessel. A luer fitting hub at the proximal end of the catheter is used for the attachment of accessories.</td>

| RQ070        | LIGASTIC reinforcement ligament   | The LIGASTIC reinforcement artificial ligament is to constitute a reinforcement or support during healing & repair of the Patellar tendon, achilles tendon, antero lateral laxity of ankle, medial collateral ligament and posterior cruciate ligament. There are different products for the reinforcement of the collateral ligaments, anterior cruciate ligament, achilles tendon, shoulder, patella tendon, popliteal tendon, ankle anterior-lateral laxity and acromial-clavicular dislocation. The product consists of warp-knitted fibres of PET. It is knitted in bands of 8, 15, 18, 22, 36 or 72 warp threads. The basic structure of LIGASTIC is always identical. However, the presentation varies depending on the actual joint affected. The ligaments presented are:  
- cylindrical string, with variable length & diameter. Diameter varies according to fiber content & required resistance. Both ends of the ligament are soft, formed as a reinforced loop, allowing an easy passage through the bone tunnels. These ends have a temporary function & are able to be cut off after the tunnel passage.  
- band, for reinforcement of a flat anatomical structure such as the medial collateral ligament in the knee  
- reinforcement ligament (uncoted LIGASTIC) - for support and healing of intra-articular or extra-articular natural ligaments | 7 sizes:

<td>C-Plate Anterior Cervical Plates are inserted via an anterior approach to the cervical spine, in order to fix one or two levels of vertebrae together. Such fixation is performed to cause bony fusion between the levels and is done in order to address pain, instability, and/or a range of other indications. The C-Plate system consists of low-profile (1.6mm thick) pre-contoured plates of varying sizes and a full range of screws. The plates themselves contain an innovative screw-locking mechanism utilising an elastic locking ring which allows the surgeon choice between semi-fixed or variable-angle self-tapping screws. Diameters: 3.5mm and 4.0mm, with lengths ranging from 10mm to 20mm in 1 mm increments</td>

<td>C-Plate Cervical Plates 22-54mm</td>
<td>C-Plate Anterior Cervical Plates are inserted via an anterior approach to the cervical spine, in order to fix one or two levels of vertebrae together. Such fixation is performed to cause bony fusion between levels and is done in order to address pain, instability, and/or a range of other indications. The C-Plate System consists of low-profile (1.6mm thick) pre-contoured plates of varying sizes and a full range of screws. The plates themselves contain an innovative screw-locking mechanism utilising an elastic locking ring which allows the surgeon choice between semi-fixed or variable-angle self-tapping screws.</td>

<td>C-Plate - Cervical Plates 56-70mm</td>
<td>C-Plate Anterior Cervical Plates are inserted via an anterior approach to the cervical spine, in order to fix one or two levels of vertebrae together. Such fixation is performed to cause bony fusion between levels and is done in order to address pain, instability, and/or a range of other indications. The C-Plate System consists of low-profile (1.6mm thick) pre-contoured plates of varying sizes and a full range of screws. The plates themselves contain an innovative screw-locking mechanism utilising an elastic locking ring which allows the surgeon choice between semi-fixed or variable-angle self-tapping screws.</td>

<td>ROI-T is a TLIF (Transforaminal Lumbar Interbody Fusion) interbody fusion cage manufactured from PPEK-Optima, designed for ease of insertion and graft maximisation. The transforaminal approach allows for exposure of the disc space by removing the facet joints and protecting the nerve roots. The disc space is entered and disc material is removed. The ROI-T cage is filled with bone graft material and is placed into the cage space to maintain the disc height and impart additional stability to the construct. Note that ROI-T cages must be used in conjunction with a posterior screw and rod system to properly stabilise the segments and enable fusion to occur. Lordotic angles 0, 5 and 9 degrees. Length 30mm. Heights: 8 to 16mm in increments of 1 mm.</td>
